## 2 Process and data flow

In this chapter, we outline the general process flow for revenue recognition according to ASC 606. We look at the data flow for creating and processing revenue accounting contracts and performance obligations in detail and place the postings in context with the recognized revenues in the SAP modules SD, PS, FI-RA, and FI-GL.

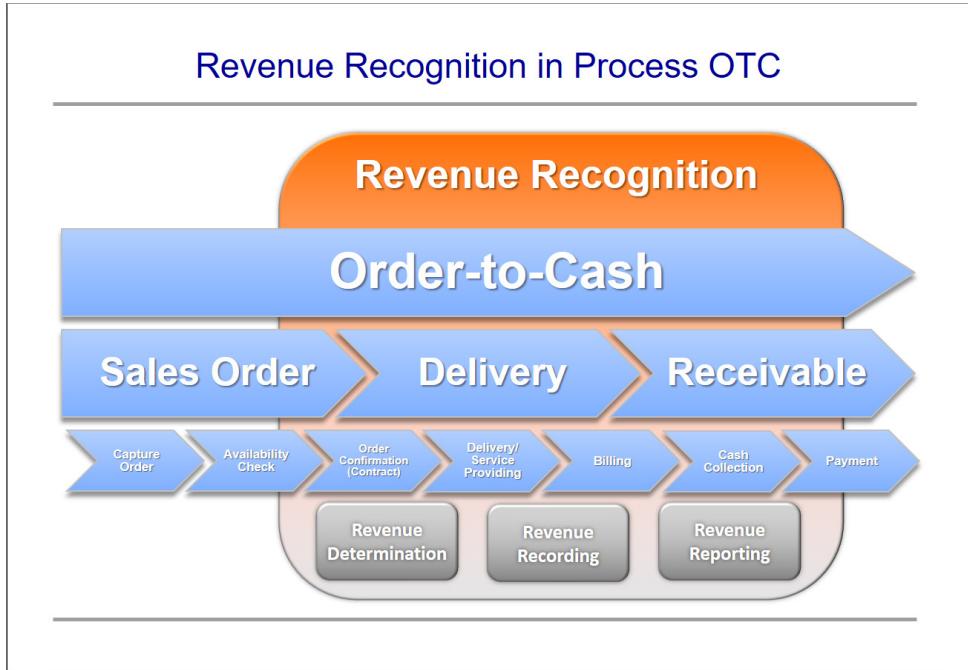

### 2.1 Impact of the standard on relevant SD business processes and applications

From the initial considerations so far, we could easily come to the conclusion that ASC 606 is a pure accounting topic. However, the regulations of the standard have far greater effects on contract management, on activities in the core of the sales and distribution processes, on supporting processes with regard to the correct timing and content for balancing accounts, as well as on further business key figures and the associated systems and applications (see Figure 2.1).

To get a complete view of the potential implications, we have to look at the following questions:

- ▶ How strongly is the company's business model affected by ASC 606?
- ▶ How relevant is the standard to existing contracts with customers and what adjustments have to be made to these contracts?
- ▶ What is the impact on the business activity of the company with regard to the future offer portfolio (bundles, multicomponent contracts, delivery and service agreements, as well as payment agreements with customers)?
- ▶ Which sales processes are affected by the impact and how much adjustment is necessary (returns processing, warranties, buy-back agreements, financing components, customer payments)?
- ▶ Which support processes—especially with regard to company and group reporting—are affected by the changes (in particular, financial statements, sales key figures, and budgeting)?

- ▶ How much adjustment is necessary for applications and systems that support the processes affected?
- ▶ To what extent are personnel processes and agreements affected (check for any required contract adjustments with regard to existing and future profit-based bonus agreements)?

*Figure 2.1: Business processes*

At this point, it becomes particularly clear that contract, sales, and distribution processes (including the underlying systems and applications) have to be analyzed and, where applicable, redefined in terms of the extensive separation of operational activities from accounting and revenue recognition.

At the same time, when implementing the requirements, it is essential to make sure that in the future, more detailed information from these processes will be made accessible to the accounting process and the creation of the financial statements. What we can conclude from this is explained at the end of the book in Section 10.2.

## 2.2 Impact of the standard on relevant PS business processes and applications

Just as we have discussed the standard SD business process flow, the PS-based process flows are also potentially impacted. In a typical scenario, for example Milestone Billing, we would now need to make sure that those are captured and allocated against other items associated with the project. One option would be to link the WBS to an SD sales order line item. Notwithstanding the execution, the underlying revenue requirement is there.

There are also scenarios around resource-related billing and how it would flow through to Revenue Accounting (FI-RA). There is the option, through configuration, to create an RA contract from the invoice generated from resource-related billing. There are also options to create a custom RAI class referencing WBS elements.

Regardless of the technical solution, the point that should be emphasized is how does the new revenue standard impact my current business processes? In analyzing that question, you will need to consider what business process changes are required to meet the new standard and how they can be implemented in the most efficient and expedient way.

## 2.3 Data flow in the context of revenue accounting

To begin our look at the technical treatment of data for this topic, we will use the following example of the data flow for a standard order (or customer contract) in SD, and in particular, in combination with the creation and processing of revenue accounting contracts (see Figure 2.2). The symbols used in the illustration each represent the objects and results from the relevant modules SD, FI-RA, and FI-GL.

We will address details with regard to the installation and the process control settings, as well as further examples from practice, with reference to a system in the following chapters.

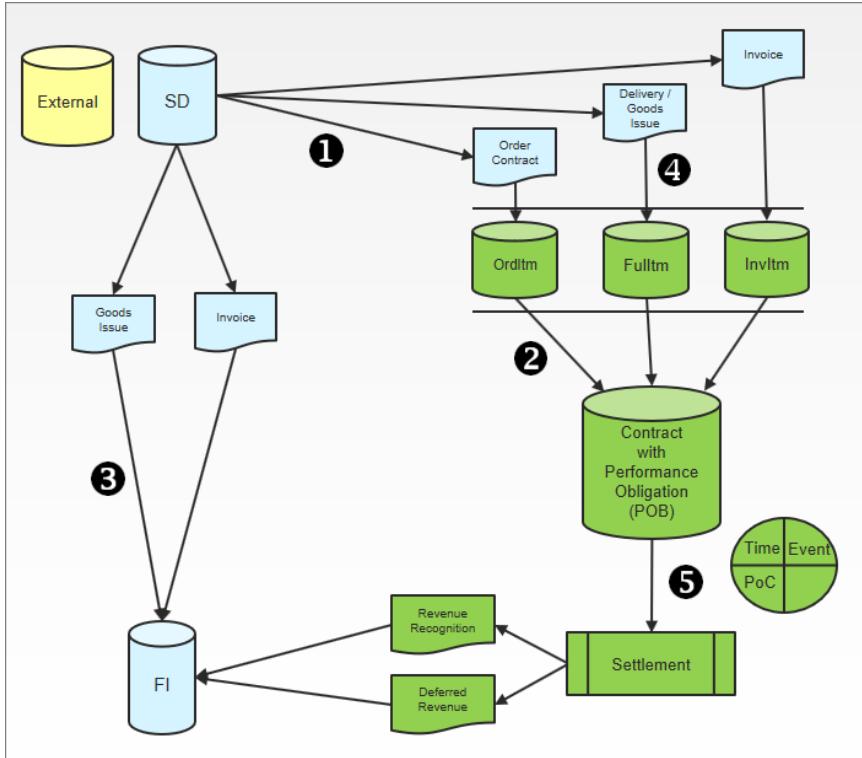

Figure 2.2: Data flow (contract and delivery)

- When Revenue Accounting (FI-RA) is activated, depending on the type of order and the types of items used in the SD document, initially a transfer area for the required data is filled: this is the *adapter reuse layer* (ARL). In this transfer area, order and contract items, as well as fulfillment and invoice items are separated into categories which, from a technical perspective, are kept in separate classes. Therefore, the standard order created is first put into the class for order items. The revenue accounting items themselves have different statuses depending on the degree of processing (Raw, Processable, Processed).

The data from the transfer area is processed further using transfer programs which are integrated in dialog or in periodically executable batch processing cycles.

- ② As a result of the data processing, a separate revenue accounting contract with corresponding performance obligations is created in the system.

The detailed characteristics of the contract and performance obligations, which at a later point become separate postings, are first determined from the customizing settings or are derived using rules defined from the BRFplus application via *decision tables*. The procedure and control parameters used here are described in detail in Section 5.4.

A complete integration of Revenue Accounting (FI-RA) with the SD module is guaranteed by the fact that, within the process described, changes (e.g., prices, deadlines, and extensions) made in an SD document after a successful transfer each lead to the revenue accounting contract created being updated.

- ③ As mentioned before, a performance obligation in a revenue accounting contract reflects a service previously agreed with the customer and recorded in an SD document taking revenue aspects into account. A revenue posting is subsequently triggered based on the parameters defined in the performance obligation. Various types of fulfillment can trigger this posting, such as the delivery or the goods issue for a contract. In principle, the following triggering events are differentiated in the system:

- ▶ Time-based
- ▶ Event-based
- ▶ Progress-based (percentage of completion)

In SD itself, the delivery (an event) triggers the creation of a goods issue, which in FI, leads to a stock change posting.

- ④ This event is also updated directly in the class for fulfillment items in Revenue Accounting (FI-RA) as information with the descriptive parameters. The related performance obligation is also updated in the revenue accounting contract the next time the periodic transfer programs are executed. A corresponding indicator shows the service agreed with the customer has been fulfilled and that, in accordance with US GAAP, recognized revenue must be reported.
- ⑤ A settlement transaction is then used to create the corresponding posting documents in FI. Because the goods issue for the contract
